

Adding Random Questions to Quizzes

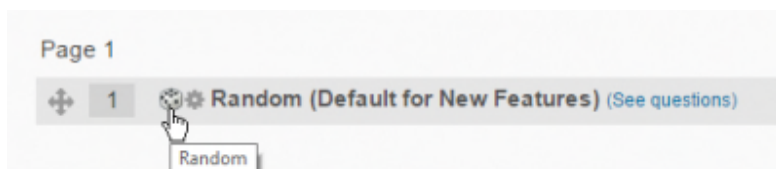

(Scholar 2.9)

January 19, 2016

As long as you have questions in the question bank, you can add random questions to your quiz by clicking 'Add' and then '+ a random question'. This might be useful if you have students in a class taking a quiz at the same time, because they are unlikely to get the same questions at the same time. The same question will never appear twice in a quiz. If you include several random questions then different questions will always be chosen for each of them. If you mix random questions with non-random questions then the random questions will be chosen so that they do not duplicate one of the non-random questions. This does imply that you need to provide enough questions in the category from which the random questions are chosen, otherwise the student will be shown a friendly error message. The more questions you provide the more likely it will be that students get different questions on each attempt. When a quiz with random questions is retaken, the random questions will be different from the ones in previous attempts.

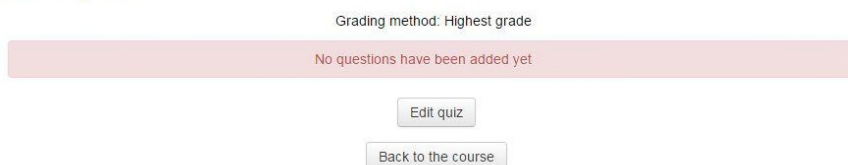

The grade for the randomly chosen question will be rescaled so that the maximum grade is what you have chosen as the grade for the random question.

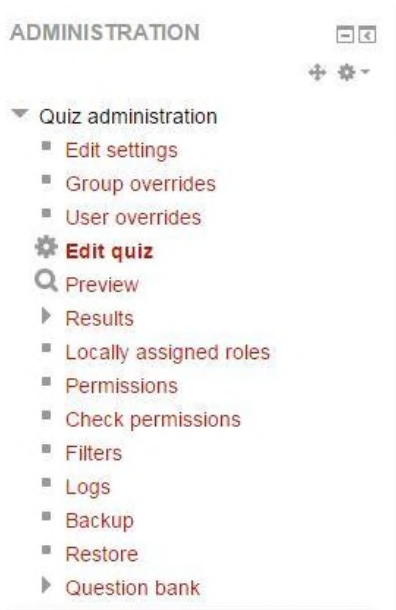

If you want to designate some questions for randomization only you can do that in the question bank itself. You can add one or more random questions by choosing the number and category in the question bank. Note the die icon to highlight random question selection.

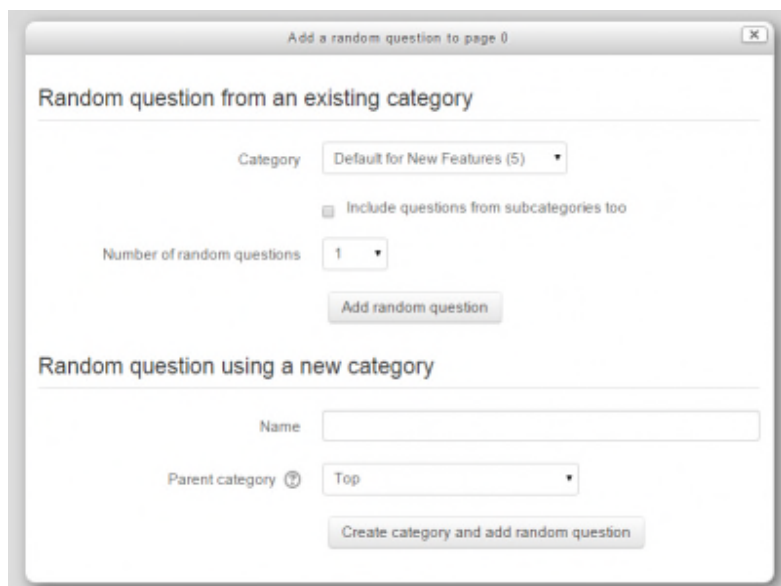

But if you want to use existing questions from your question bank pool of questions and tell your quiz how many random questions to use open your quiz and click on the **“EDIT QUIZ”** command located in the Administration block or when you click on the quiz from the front page of the class.

fake quiz

Then click on the word **“ADD”** located on the right hand side of the screen and the following box appears allowing you to choose how many random questions you wish to have.
